

## NETLAS NEWSLETTER 11-2022

### **Deputy Vice-Chancellor Research and Innovation** **[Professor Shane Weller](#) from Kent University** **Visits the Applied Optics Group (AOG)**

**23<sup>rd</sup> November 2022**

AOG had the privilege to receive a visit by the Deputy Vice-Chancellor Research and Innovation Professor Shane Weller from Kent University. The visit started with a presentation given by the head of AOG Prof Adrian Podoleanu, followed by the tour of the labs.

We are happy to report that Professor Weller was impressed by our research results and collaborations and acknowledged the need for the continuation of the funding for the [Summer Vacation Research Competition](#). Prof Weller said: *"I am happy to have had the opportunity to meet you all and hear about your amazing research. You are a strong team, I am glad to see new PhD Students and Postdocs. I learned a lot from this visit, and I hope I can find the way to support your research in the future"*.

Professor Shane Weller visits the AOG

## **SPIE Student Paper Price** for two **NETLAS PhD Students**

With the occasion of the 25th Congress of the International Commission for Optics [ICO-25 Conference](#), Dresden, Germany (5-9 Sept 2022), NETLAS PhD Students [Irene Rodriguez Lamoso](#) from [Technical Univ of Darmstadt](#), Germany and [Sacha Grelet](#) from [NKT Photonics](#), Denmark, received SPIE Student Paper Price for their contributions.

Sacha's title presentation was *"40 MHz A-scan rate OCT at 1060 nm using a swept-source based on time stretch and low-noise supercontinuum"* and Irene's poster title was *"Towards optical coherence tomography based on electrically pumped MEMS-VCSEL as swept source in the C and L band"*.

## ***Congratulations Irene and Sacha!***

## SECONDMENTS

**Netlas PhD Student**

**Philipp Tatar-Mathes**

**Recruited by:** Tampere  
University, Finland

**Secondment started on 25<sup>th</sup>**  
**November 2022**

University of Kent, UK

**Applied Optics Group (AOG)**

**Duration: three months**

**PhD Project:** Broadband gain blocks for amplified swept source

During my secondment in Kent University, I will get deep insights into the working principles of OCT by working alongside Dr. Manuel Marques on a polarization-sensitive OCT setup. This differs quite a lot from my typical daily work in Tampere, and I am excited and looking forward to learning something new.

Before coming here, I was very lucky to find so many communicative colleagues that took their time with any concern that I came up with. Thank you, guys, (Rene, Adrian Fernandez, Manuel, Alejandro, Ramona) so much for everything, housing was also not a problem at all!

## Good luck Philipp!

## OPTICA Student Chapter event, AOG, Kent University

28<sup>th</sup> October 2022, at 6 pm in Kennedy Seminar Room 2,  
Kent University

**OPTICA Student Chapter organized a presentation given by former AOG  
PhD student Dr Sophie Caujolle**

Sophie completed postgraduate study in Applied Optics at Kent University and now works as Technology Scout at [Heidelberg Engineering](#), Germany. Sophie's hybrid talk outlined **the experience of transitioning to industry from academia**, talk which was also live broadcast.

@Photos by OPTICA and Dr Ramona Cernat

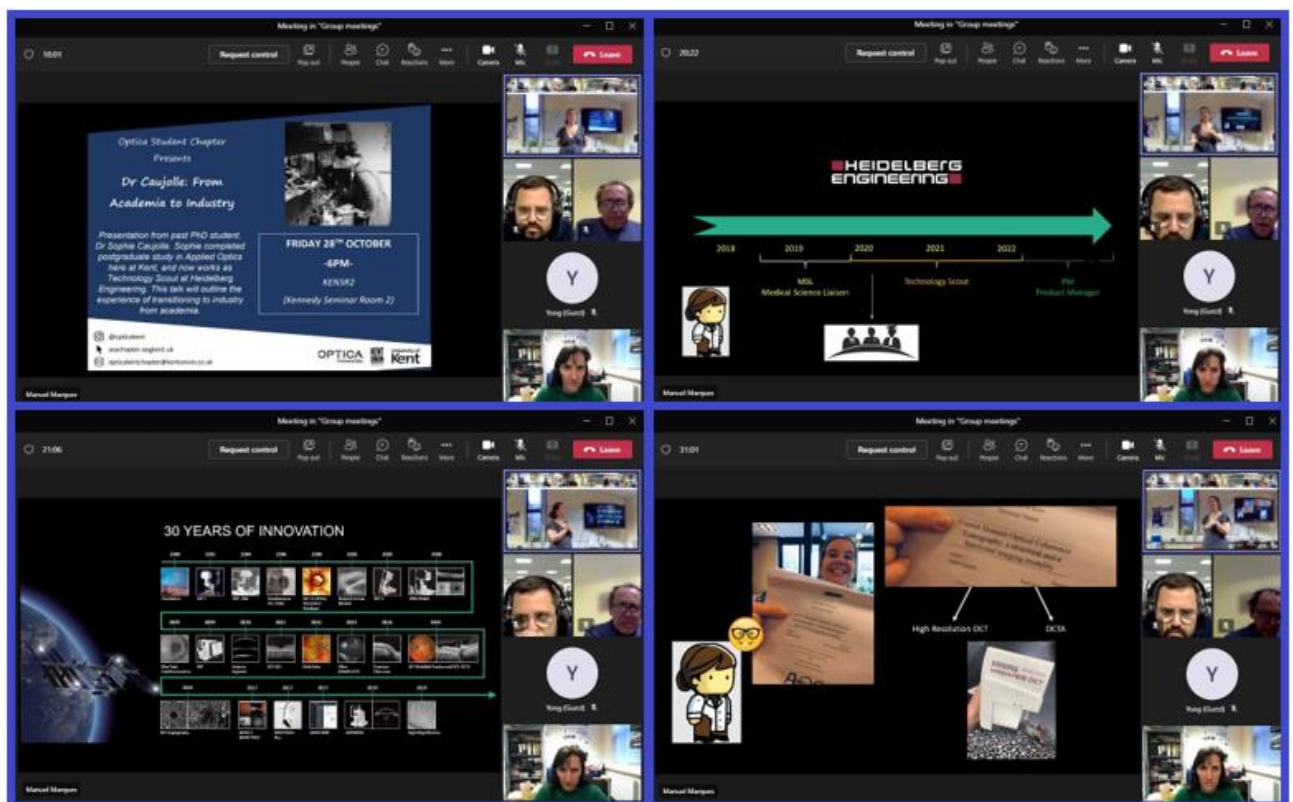

@@Thank you, Sophie, for sharing with our students your experience of  
transitioning to industry from academia

## Dr Sophie Caujolle visit the AOG, Kent University

31<sup>th</sup> October 2022 at 4 pm

[OPTICA Student Chapter](#) Kent University branch invited Dr Sophie Caujolle to give a presentation to their members & Kent University students on 28<sup>th</sup> October 2022 at 6 pm. Having this opportunity, as a former member of AOG, Sophie visited the AOG labs on 31<sup>st</sup> October and gave a hybrid scientific presentation to the AOG members. A few print screens from her presentation will follow.

A few print screens from Dr. Sophie Caujolle's presentation

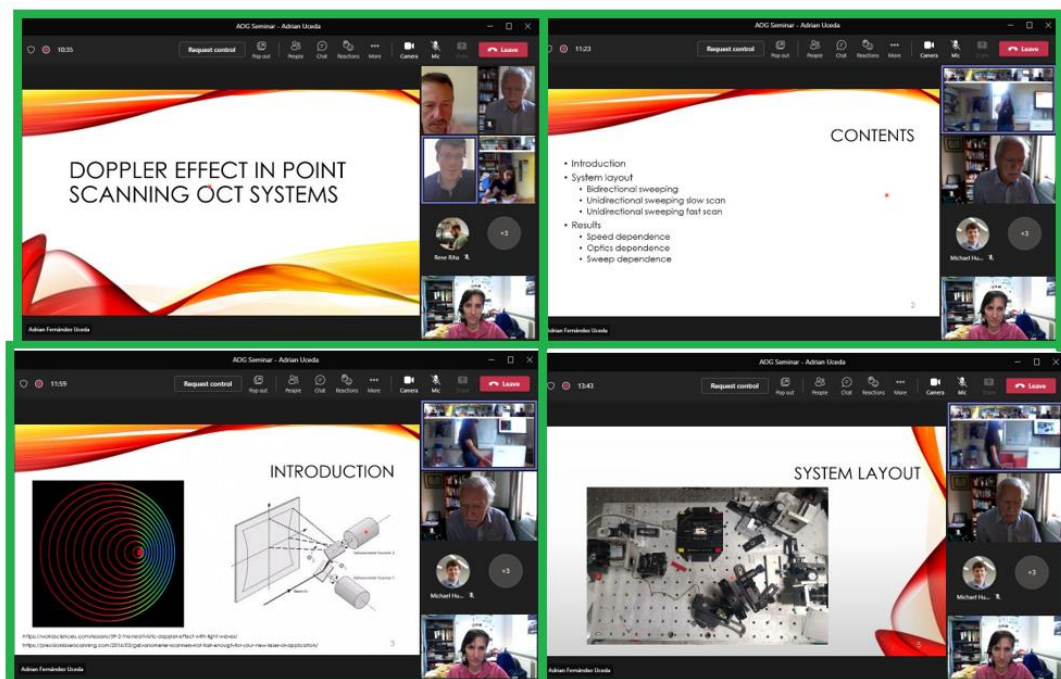

## AOG Journal Club

11<sup>th</sup> November 2022, 12 pm UK time

[AOG PhD Student Adrián Fernández Uceda](#) presented some results of his research with the title “**Doppler effect in point scanning OCT systems**”.

**Summary:** Most Swept Source OCT systems use some sort of scanning to compose the full volume of a sample, with galvo scanners (GS) being one of the main choices as scanning drivers. Upon imaging, the speed of the GS is dependent on the size of the scanned area, the A-scan line rate and the number of A-scans per B-scan and per volume. As the swept sources become faster, the scanning speed can be increased, and this poses a risk for doppler artefacts to appear in the image obtained. By using a bidirectional swept source, we managed to study the effects of the doppler shift occurred due to the increase of speed from the GS. We present different results based on changes in the alignment and optical components in the OCT systems, changes on the speed of the GS and changes of the sweep direction of the source and how these factors are interconnected, leading to larger or smaller artefacts in the final image. For all the results, three different setups were employed, using sources that range from 2kHz to 100kHz sweep rate, some commercial, some experimental. We hope that a better understanding of this effect and its relations with the setup can lead to better control of the alignment, as well as being a source of concern for possible errors in the assessment of medical images.

## PUBLICATIONS

### Bright Quantum Dot Single-Photon Emitters at Telecom Bands Heterogeneously Integrated on Si

Pawel Holewa, Aurimas Sakanas, Ugur M. Gur, Pawel Mrowinski, Alexander Huck, Bi Ying Wang, Anna Musial, **Kresten Yvind**, Niels Gregersen, Marcin Syperek, **Elizaveta Semenova\***

*ACS Photonics* 2022, 9, 7, 2273–2279

<https://doi.org/10.1021/acsp Photonics.2c00027>

Whereas the Si photonic platform is highly attractive for scalable optical quantum information processing, it lacks practical solutions for efficient photon generation. Self-assembled semiconductor quantum dots (QDs) efficiently emit photons in the telecom bands (1460–1625 nm) and allow for heterogeneous integration with Si. In this work, we report on a novel, robust, and industry-compatible approach for achieving single-photon emission from InAs/InP QDs heterogeneously integrated with a Si substrate. As a proof of concept, we demonstrate a simple vertical emitting device, employing a metallic mirror beneath the QD emitter, and experimentally obtained photon extraction efficiencies of ~10%. [Read More](#)

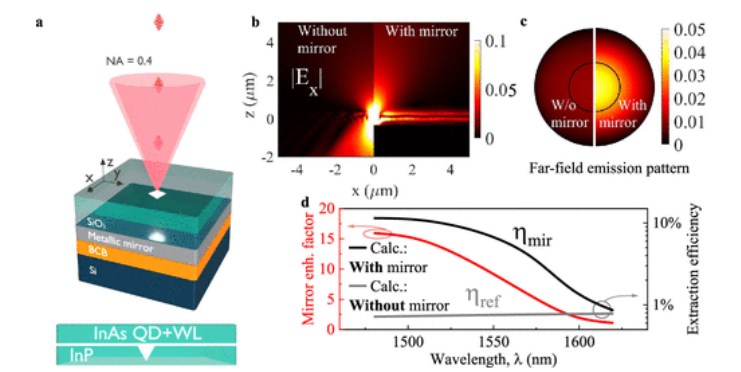

Figure 1. Design of our structures and theoretically estimated performance. (a) Investigated structure scheme, consisting of InAs/InP quantum dots (QDs) with a metallic reflector integrated on a Si substrate. WL, wetting layer. (b) The electric field component  $|E_x|$  for  $\lambda = 1550$  nm for the structure without (left) and with (right) a metallic reflector made of aluminum (Al). (c) Calculated far field emission ( $P_{\text{lens,NA}}$ ) for the reference (left) and the device with an Al mirror (right). The half-circle marks the collection cone of a 0.4 NA objective. (d) Calculated broadband mirror enhancement factor (left axis) and photon extraction efficiency for the QD device with a mirror ( $\eta_{\text{mir}}$ ) and the reference structure without a mirror ( $\eta_{\text{ref}}$ ) as a function of emitter wavelength.

## Electrically-driven Photonic Crystal Lasers with Ultra-low Threshold

Evangelos Dimopoulos, Aurimas Sakanas, Andrey Marchevsky, Meng Xiong, Yi Yu, **Elizaveta Semenova**, Jesper Mørk, **Kresten Yvind**

Lasers & Photonics Review, 2022

<https://doi.org/10.1002/lpor.202200109>

Light sources with ultra-low energy consumption and high performance are required to realize optical interconnects for on-chip communication. Photonic crystal (PhC) nanocavity lasers are one of the most promising candidates for this role. In this work, a continuous-wave PhC nanolaser with an ultra-low threshold current of 10.2  $\mu\text{A}$  emitting at 1540 nm and operated at room temperature is demonstrated. The lasers are InP-based bonded on silicon (Si), and comprise a buried heterostructure active region and lateral p-i-n junction, feature CMOS-compatible drive voltage, and exhibit low self-heating. [Read More](#)

The inset shows a close-up of the  $L-I$  curve at the region around the threshold. b) OSA trace at 100  $\mu\text{A}$  injection current. c) The spectral evolution of the laser for different injection currents. d) The peak wavelength and the linewidth of the emission peak as a function of the injection current.

## Influence of the linewidth enhancement factor on the signal pattern of Fourier domain mode-locked lasers

Özüm Aşırım, **Robert Huber**, and Christian Jirauschek

November 2022, Applied Physics B 128(12)

DOI:[10.1007/s00340-022-07933-5](https://doi.org/10.1007/s00340-022-07933-5)

Fourier domain mode-locked (FDML) lasers are frequency-swept lasers that operate in the near-infrared region and allow for the attainment of a large sweep-bandwidth, high sweep-rate, and a narrow instantaneous linewidth, all of which are usually quite desirable characteristics for a frequency-swept laser. They are used in various sensing and imaging applications but are most commonly noted for their practical use in optical coherence tomography (OCT). An FDML laser consists of three fundamental components, which are the semiconductor optical amplifier (SOA), optical fiber, and the wavelength-swept optical bandpass filter. [Read More](#)

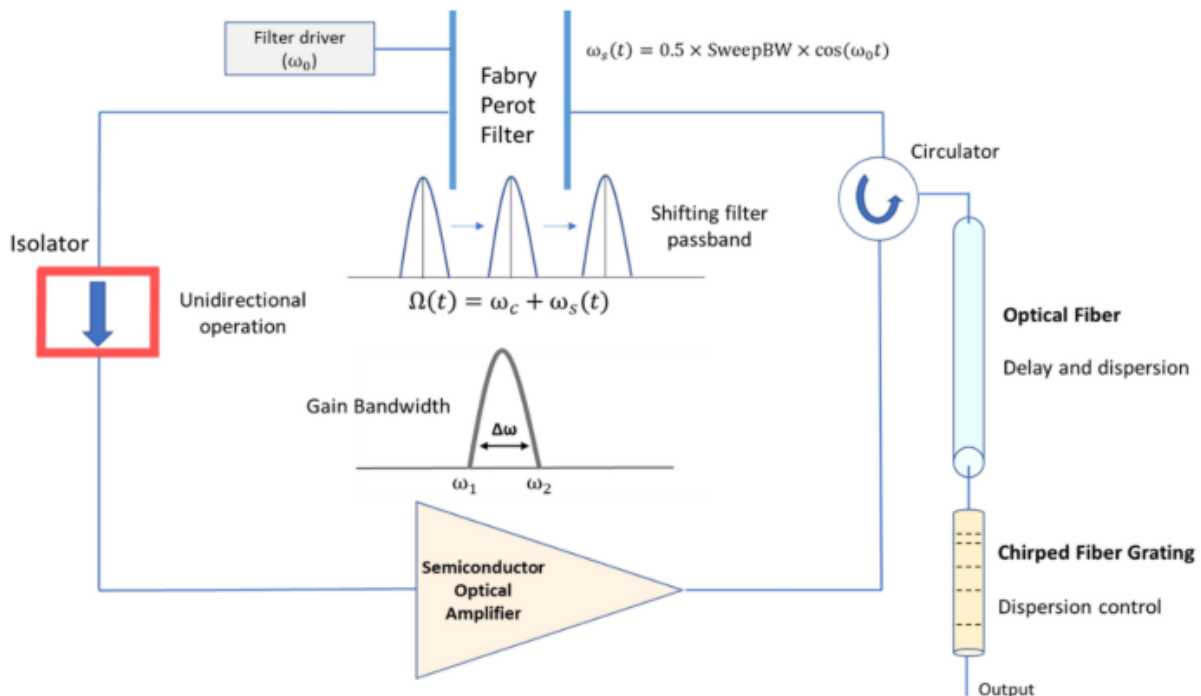

Fig.5 Configuration of an FDML laser. Basic components of an FDML laser include the SOA for light amplification, the long optical fiber for delay imposition, and the Fabry–Perot filter for tunable filtering

## Central posterior hyaloidal fibrosis – A novel optical coherence tomography feature associated with choroidal neovascular membrane

Hina Khan, Rida Amjad, **Pearse Keane**, Alastair Denniston, Brandon Lujan

American Journal of Ophthalmology Case Reports 28(2):101709, Sept 2022

DOI:[10.1016/j.ajoc.2022.101709](https://doi.org/10.1016/j.ajoc.2022.101709)

### Purpose

To describe a novel optical coherence tomography (OCT) finding at the vitreomacular interface (VMI), and report its association with advanced choroidal neovascularisation (CNV).

### Observations

Optical coherence tomography (OCT) scans performed at three retinal imaging centres at Amanat Eye Hospital, Pakistan from May 2016 till May 2021 were reviewed. A specific change at the vitreomacular interface was noted consisting of abnormal hyper reflectivity at the point of attachment of the posterior hyaloid membrane to the foveal center which appears to ‘fill in’ the foveolar depression. Eight eyes of eight patients were identified.

## How to improve microendoscopes? New probe design brings promises to improve biomedical imaging

Microendoscopes are the cornerstone of modern medical diagnostics – they allow us to see what we could not even describe two decades ago. The technology is constantly improving, with ICTER scientists contributing to the development of the probes.

Microendoscopes using fiber optics are becoming increasingly important imaging tools, but they have physical limitations. They are essential for applications that require a long working distance, high resolution, and a minimum probe diameter. The research paper titled “[Superior imaging performance of all-fiber, two- focusing-element microendoscopes](#),” by Dr. Karol Karnowski of ICTER, Dr. Gavrielle Untracht of the Technical University of Denmark (DTU), Dr. Michael Hackmann of the University of Western Australia (UWA), Onur Cetinkaya of ICTER and Prof. David Sampson of the University of Surrey, sheds new light on modern microendoscopes. It is noteworthy that the research work started while the authors worked in the same research group at UWA.

In it, the researchers showed that endoscopic imaging probes, particularly those for so-called side viewing, combining fiber-optic (GRIN) and spherical lenses, offer excellent performance over the entire range of numerical apertures and open the way to a broader range of imaging applications. In the publication, the performance of endoscopic imaging probes is comparable to commonly used single focusing element probes.

## Chip-scale high-peak-power semiconductor/solid-state vertically integrated laser

Yue, J. et. Al.

*Nature Communications* volume 13,  
Article number: 5774 (2022)

<https://doi.org/10.1038/s41467-022-33528-x>

Compact lasers capable of producing kilowatt class peak power are highly desirable for applications in various fields, including laser remote sensing, laser micromachining, and biomedical photonics. In this paper, we propose a high-peak-power chip-scale semiconductor/solid-state vertically integrated laser in which two cavities are optically coupled at the solid-state laser gain medium. The first cavity is for the intra-pumping of ytterbium-doped yttrium aluminum garnet (Yb:YAG) with an electrically driven indium gallium arsenide (InGaAs) quantum well, and the second cavity consists of Yb:YAG and chromium-doped yttrium aluminum garnet (Cr:YAG) for passive Q-switching. [Read More](#)

**Fig. 4: Experimental results of the mechanically assembled laser.**

**a** I–L characteristics.

**b** Single-pulse waveform. The vertical axis was calculated from the obtained pulse energy (12.1  $\mu\text{J}$ ) and the pulse waveform.

**c** Temporal waveform.

**d** Optical spectrum. The data presented in **b–d** were measured at an injection current of 370 mA.

## **A bold new vision**

### **The Luxonus photoacoustic imaging device offers an entirely new perspective on medical imaging**

In 2021, [Luxonus](#), a Japanese startup, created an extraordinary picture of the medial side of a lower leg. In vivid, colourized 3D, the image showed the complex network of small and large vessels inside the leg and the flow of blood through it. Compared to any other type of medical imaging, the detail is unprecedented. [Luxonus](#) used its new device, a game-changing photoacoustic 3D scanner that deploys the relatively new science of [photoacoustic imaging](#) (see [basics of Photoacoustic 3D Imaging Technology](#)). The Luxonus photoacoustic imaging device is a next-generation medical imaging technology that generates much more data, in far greater detail, with less risk and less burden for patients and operators, and at a significantly lower cost than [ultrasound](#), [computed tomography](#) (CT), and [magnetic resonance imaging](#) (MRI).

The advantages of the photoacoustic 3D scanner over MRI and CT are many. Unlike MRI and CT, the photoacoustic 3D scanner is able to allow for colour differentiation of veins and arteries to detect the oxygen saturation of the blood. Unlike CT scans, no contrast agent is required for vascular imaging, and radiation, such as X-rays or the powerful magnetic fields used in MRI, poses no risk to either patient or machine operator. [Read More](#)

## [Izatt Named Chair of Biomedical Engineering at Duke](#)

*Joseph A. Izatt, a globally recognized expert in medical imaging, will lead Duke BME through 2025 with a focus on research and educational excellence and innovation*

[Joseph A. Izatt](#) has been appointed chair of Duke's Department of Biomedical Engineering. An internationally recognized expert in medical imaging innovation, respected student mentor and advisor, and faculty leader, Izatt has served as interim chair since July and will now lead Duke BME until June 2025.

"After seeing the energy and dedication he brings to the position, even in a temporary capacity, I quickly concluded that Joe would be an excellent choice for chair," said Jerome P. Lynch, Vinik Dean of Engineering at Duke. "His first-hand experience in translation of innovation from lab to clinic makes Joe a fantastic resource to lead Duke BME into its next phase of growth, which will emphasize deepening its positive impact on society."

The [Izatt Biophotonics Lab](#) continues to seek further innovations with the promise of improving human health—including new methods of non-invasive medical diagnostics, *in vivo* tomographic microscopy, and real-time, image-guided robotic surgery. The lab's expertise in OCT technology has also allowed it to expand beyond the realm of biomedical imaging, such as investigating how OCT could [help autonomous robots and vehicles to see better](#).

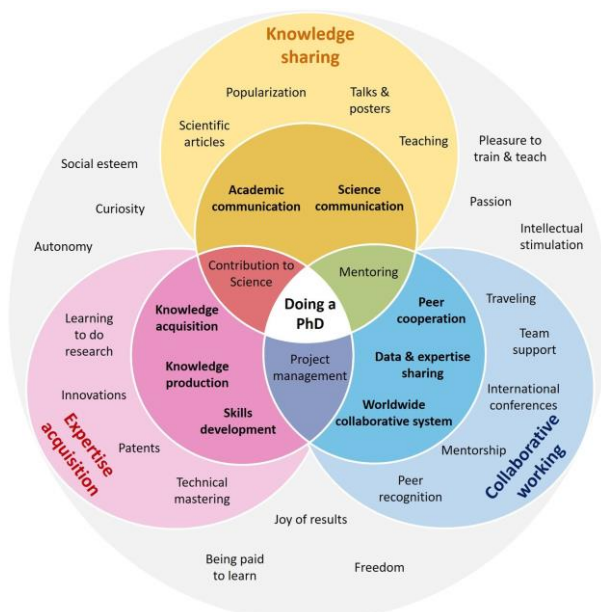

Izatt is a partner in a decades-long [interdisciplinary collaboration with Cynthia Toth](#), a medical doctor and Duke professor of ophthalmology. Their work to improve the accuracy of examination and surgery of the eye has led to handheld OCT systems for infants and the first intraoperative OCT-guided system for eye surgery.

## Research Culture: Highlighting the positive aspects of being a PhD student | eLife (elifesciences.org)

### Three benefits of doing a PhD

There are two primary outputs from a PhD: new skills and expertise for the graduate, and new knowledge for the wider world. In this article we focus on the former and discuss the three main benefits of doing a PhD for the individual: (i) the development of specific skills to become an expert; (ii) the ability to work in a collaborative environment; (iii) improved communication skills while sharing knowledge (Figure 2). For each of these benefits we discuss both general aspects that apply to most doctoral students, and specific aspects that depend on the student's supervisor, field of research, location and other factors.

**Fig.2**

### The positive aspects of doing a PhD.

The three primary benefits of doing a PhD are acquiring expertise (**pink circle**), learning to work in a collaborative environment (**blue**), and developing communication skills for sharing knowledge (**yellow**). For each benefit, general aspects that apply to almost all doctoral students are shown in bold type in the small circle, and specific aspects that depend on, for example, the student's supervisor or field of research are shown in plain type in the large circle. The large grey area contains more abstract and subjective ideas that are not discussed in the main text. It should be noted that this figure is conceptual, and that the aspects and ideas in it could be grouped in other, equally valid, ways.

### **The Advanced Applications for Optical Coherence Tomography in Skin Imaging**

By QIUYUN XU

**Wayne State University, Detroit,  
Michigan**

#### **Abstract**

Optical coherence tomography (OCT), based on low coherent interferometry, is an FDA approved non-invasive imaging modality. It uses a low coherent near-infrared laser around the wavelength of 1300 nm [1]. OCT has been widely used in ophthalmology to assess retina thickness and anatomical changes. In 1997, this technology was tested to image the cross-section of human skin in vivo, and it was able to visualize different skin layers and skin appendages [2]. Although, OCT has great potential in monitoring skin morphologic changes, skin cancer diagnosis, and tumor margin assessment [3], it is not well recognized and adopted by many dermatologists.

## Optics | Laser Focus World

### Fully automated compact wavelength selection for broadband light sources

A newly developed technique based on rotatable optical broadband filters helps with the selection of wavelengths and adjustment from the UV to near-IR range when using a broadband light source.

FIGURE 1. Schematic diagram of TwinFilm technology.

Selecting a proper wavelength is a critical procedure for spectroscopy and microscopy. Traditional methods such as filters, monochromators, and acousto-optic tunable filters have advantages and disadvantages. Users choose the best item suited to their purpose of use, costs, required properties, and compatibility with their system. A newly developed technique based on rotatable optical broadband filters allows users to select a wavelength and adjust width from ultraviolet (UV) to the near-infrared (near-IR) range when using a broadband light source. [News - Vexlum](#)

## [NKT Photonics is improving their aeroGAIN fiber amplifier](#)

[NKT Photonics](#) have demonstrated 233  $\mu\text{J}$  pulse energy and 357 fs pulse duration at 175 W average power at 1030 nm in a chirped-pulse-amplification system using our new and improved aeroGAIN-ROD fiber amplifier.

Increased demand for high-quality glass cutting and processing, drives the adoption of femtosecond lasers. Many applications within micromachining demand both high pulse energies and average power to handle a wide range of materials and processes at high throughput.

The high-power ultrashort laser pulse can vaporize glass with almost no heat conduction in a cold ablation process that leaves a perfect edge without any thermal damage or micro-cracks, as typically seen with long-pulse lasers.

Motivated by these demands, [NKT Photonics](#) have worked on further power-scaling [their unique aeroGAIN-ROD PCF platform](#) and **have managed to increase the average power handling by 2.5 times.** [Read More](#)
